Attempt : 1
Total Mark : 40
Marks Obtained : 40

Section 1 : Coding

1. Problem Statement

Ravi is analyzing text messages for his research on typing patterns. He wants to count the number of uppercase letters, lowercase letters, and digits in a sentence to understand typing trends.

Your task is to help Ravi by writing a program that takes a sentence and prints the count of uppercase letters, lowercase letters, and digits.

Input Format

The input contains a single line containing a sentence (string).

Output Format

The output prints three integers separated by spaces:

- Number of uppercase letters
- Number of lowercase letters
- Number of digits

Refer to the sample output for formatting specifications.

Sample Test Case

Input: Hello World 123

Output: 2 8 3

Answer

```
// You are using Java
import java.util.Scanner;
```

```
class Ty {
    public static void main(String[] args) {
        Scanner sc = new Scanner(System.in);
        String sentence = sc.nextLine();

        int uppercaseCount = 0;
        int lowercaseCount = 0;
        int digitCount = 0;

        for (int i = 0; i < sentence.length(); i++) {
            char ch = sentence.charAt(i);
            if (Character.isUpperCase(ch)) {
                uppercaseCount++;
            } else if (Character.isLowerCase(ch)) {
                lowercaseCount++;
            } else if (Character.isDigit(ch)) {
                digitCount++;
            }
        }

        System.out.println(uppercaseCount + " " + lowercaseCount + " " +
            digitCount);
    }
}
```

Status : Correct

Marks : 10/10

2. Problem Statement

Riya is preparing a puzzle game for her friends. She wants to include a feature that highlights special words in a sentence — specifically, palindromic words (words that read the same forward and backward).

Your task is to help Riya by writing a program that extracts all palindrome words from the given sentence. If there are no palindromes, print "No palindromes found".

Input Format

The input contains a single string S representing a sentence.

Output Format

The output prints all palindromic words separated by a space.

If no palindrome exists, print "No palindromes found".

Refer to the sample output for formatting specifications.

Sample Test Case

Input: madam went to school

Output: madam

Answer

```
// You are using Java
import java.util.Scanner;
```

```
class P {
    public static void main(String[] args) {
        Scanner sc = new Scanner(System.in);
        String sentence = sc.nextLine();

        String[] words = sentence.split(" ");
```

```

StringBuilder palindromes = new StringBuilder();

for (String word : words) {
    if (isPalindrome(word)) {
        if (palindromes.length() > 0) {
            palindromes.append(" ");
        }
        palindromes.append(word);
    }
}

if (palindromes.length() > 0) {
    System.out.println(palindromes.toString());
} else {
    System.out.println("No palindromes found");
}
}

private static boolean isPalindrome(String word) {
    int left = 0;
    int right = word.length() - 1;
    while (left < right) {
        if (word.charAt(left) != word.charAt(right)) {
            return false;
        }
        left++;
        right--;
    }
    return true;
}
}

```

Status : Correct

Marks : 10/10

3. Problem Statement

Sana is analyzing text for a secret code. She wants to find all words in a sentence that start and end with the same letter. These words are considered "special words" for her analysis.

```

        specialWords.append(" ");
    }
    specialWords.append(word);
}
}

if (specialWords.length() > 0) {
    System.out.println(specialWords.toString());
} else {
    System.out.println("No special words found");
}
}
}

```

Status : Correct

Marks : 10/10

4. Problem Statement

At a digital library, the system needs to analyze passages to identify the frequency of vowels, since they are key for linguistic research. You are asked to write a program that counts the number of vowels in each passage of text.

The vowels of interest are:

a, e, i, o, u (both uppercase and lowercase).

Input Format

The first line of input contains an integer T, representing the number of test cases (passages).

Each of the next T lines contains a single passage of text.

Output Format

For each test case, print a single integer representing the total number of vowels in the passage.

The first line of output corresponds to the first passage, the second line to the second passage, and so on.

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 1
Hello World

Output: 3

Answer

// You are using Java
import java.util.Scanner;

```
class S {  
    public static void main(String[] args) {  
        Scanner sc = new Scanner(System.in);  
        int T = sc.nextInt();  
        sc.nextLine();  
  
        for (int i = 0; i < T; i++) {  
            String line = sc.nextLine();  
            int count = 0;  
            for (int j = 0; j < line.length(); j++) {  
                char c = Character.toLowerCase(line.charAt(j));  
                if (c == 'a' || c == 'e' || c == 'i' || c == 'o' || c == 'u') {  
                    count++;  
                }  
            }  
            System.out.println(count);  
        }  
    }  
}
```
